Pyramids of Ancient Egypt

BUILDING PYRAMIDS

The pyramid is the most stable structure you can build. It's almost impossible to topple over. Early civilizations used this shape as it was easy to create and didn't require complicated engineering skills. Imagine piling up rocks, dirt, or sand. These will naturally fall into a pyramid shape.

PYRAMIDS OF ANCIENT EGYPT

The most famous pyramid structures in the world are those of Egypt from the ancient Egyptian empire. The three pyramids at Giza were designed as tombs for Egyptian kings or pharaohs. They were made around 2600 BCE, and their impressive construction means they are the only Ancient Wonder of the World that you can still visit.

CONSTRUCTION OF THE PYRAMIDS

The Great Pyramid is comprised of approximately 2,300,000 limestone and granite blocks, each weighing an average of 2.5 tons for a total weight of 5,750,000 tons. Some archaeologists estimate it took 4,000 skilled laborers at least 20 years to build it! On the following website, you'll read some more information about how these ancient wonders were built. Prepare to answer some questions.

Draw It

It was common for Pharaohs to be buried with their most important possessions. Imagine this was a pyramid built for you. Draw some things you would include in your pyramid.
